Humidity and moisture measuring devices

WOOD, HUMIDITY AND CONSTRUCTION MOISTURE

Protection against moisture is a major problem in buildings. Early detection of building and material moisture contribute to the sustained protection and preservation of building fabric. Moisture assessment and localisation with suitable instruments is essential for this. Early detection can also prevent harmful mould and mildew infestation. Non-destructive material moisture detection using the capacitive measuring method, ensures measurement results are obtained effortlessly and quickly: without damaging the surface during and especially after the construction phase. Measuring instruments utilising the precision measuring concept are used to determine the moisture in various building materials. This measuring method provides very accurate results.

Moisture assessment – Darr method

$$700,0g - 640,0g = 60,0g$$

$$\frac{60,0g}{640,0g} = 9,38\%$$

CM method – Calcium carbide measuring method

The calcium carbide measuring method is based on a chemical principle, whereby building material samples (1) are tested for moisture in a pressure tank (2).

Stainless-steel balls
for crushing

Non-destructive measurement MoistureMaster Compact Plus
The MoistureMaster Compact Plus can indicate the comparative value in CM% by means of the non-destructive, electronic measuring method.

Crossline- and line lasers

INTERIOR FINISHING AND BUILDING

The ideal laser measuring device for interior and dry finish work. Simple handling – these devices align themselves automatically. Bright laser lines make them ideally suited for laying tiles, wall studding, window installation and much more. The line lasers with laser receiver can even be used outdoors. The best visibility is offered by green line lasers.

High-performance class laser diodes produce extremely bright laser lines. They remain visible even on surfaces at great distances or on dark surfaces as well as under bright ambient light conditions. By green quality diodes the visibility is further enhanced.

The laser beam is aimed exactly at the tip of a precisely sharpened cone and is deflected from the reflective surface in a circular manner. This creates a highly accurate continuous, circumferential 360° laser line.

Green looks 6 times brighter than red. This makes possible applications on dark surfaces, over long distances and working even in very bright ambient light conditions. A red laser with a wavelength of 635 nm is used as reference for the difference in brightness.

Long battery operating time thanks to powerful lithium-ion rechargeable battery

HIGH POWER

Extremely bright green laser technology achieves high-quality lines: precise, clear and therefore easily visible.

The measuring instruments are characterised special protection against dust and rain.

Laser class

Transport LOCK: Units with "Automatic Level" are protected with a pendulum lock during transport. A special motor lock protects units with "Sensor Automatic".

Automatic alignment of the device with a magnetically dampened pendulum system. The devices are set to their initial position and align themselves automatically in a matter of seconds.

Perfectly compatible: USB-C charging standard

Powerful technology

Laser receiver – ideal for outdoor applications

Line laser with RX-/GRX-Ready technology

RX- and GRX-READY technology enables line lasers to be used even in unfavourable light conditions.

The laser lines pulsate at a high frequency and this can be picked up by special laser receivers over long distances.

Hybrid and rotary lasers

INTERIOR FINISHING WORK, ABOVE AND BELOW GROUND CONSTRUCTION

Rotary lasers are used for a variety of accurately convey heights, alignments and slopes over great distances, even in poor visibility. Laserliner rotary lasers make measuring easier and safer and present numerous application options. Their reliability and accuracy have proved themselves in practical applications, even in very unusual situations.

Laser 635 nm

Rotary lasers with 635 nm technology have a large temperature range in which they operate reliably. Visibility is limited to indoor area applications.

Laser 515 nm

Green looks 6 times brighter than red. This makes possible applications on dark surfaces, over long distances and working even in very bright ambient light conditions. A red laser with a wavelength of 635 nm is used as reference for the difference in brightness.

Automatic alignment of the device...

...with electronic vials and positioning motors controlled by temperaturestable sensors for automatic alignment of devices.

...with a magnetically dampened pendulum system.

The devices are set to their initial position and align themselves automatically in a matter of seconds.

ADS
Tilt

Prevents erroneous or inaccurate measurements: Continuous monitoring of the alignment of the laser is activated 20 or 30/35 seconds after automatic levelling. Measurements will be suspended as a precaution if the device is disturbed unintentionally or moves due to the influence of external factors.

Additional function for all units with „Sensor Automatic“: The electronic permanently levels the units even if these are moving. For quick levelling, on vibrating surfaces and windy weather.

lock

lock

Transport LOCK: Units with „Automatic Level“ are protected with a pendulum lock during transport. A special motor lock protects units with „Sensor Automatic“.

RECHARGE

Laser class

The measuring tools are characterised by specific protection against dust and rain.

Automatic levelling instruments

PRACTICAL UNIVERSAL DEVICES

Levelling instruments are used for special tasks on large building sites. They work like a precision telescope, with an artificial target line generated at a specified height – the horizontal reference. An automatic leveller automatically adjusts the target line in the horizontal plane.

Horizontal circle with endless vernier adjustment for precise targeting.

Practical, adjustable fold-up mirror for simple alignment with a circular spirit level.

Long-distance scale with E graduation

The 165 cm tall, ball-head tripod allows an AL 26/32 to be aligned rapidly.

Measuring with level

To determine the height difference in the example shown here, the levelling staff is first set up at Point A. The optical system of the level has automatically aligned itself horizontally. With the help of the optical sight marking, it is now possible to read off the distance between Point A and the sight line shown in blue. The staff can now be positioned at any Point B, and the second measuring point read off through the sight.

Calculation of height difference

Height A - Height B = Height difference H
